Rework/rewrite AIP update functionality

Since version 4, Rosetta includes a feature called AIP update. This feature is used mainly by libraries to alter data in the permanent repository, which might be necessary for a number of reasons. Metadata might need updating due to a typo or due to new research results, new files that weren't included in the original ingest might be added, or existing files might be altered with higher resolution versions or to repair defective files. Libraries tend to use this feature, because they regularly support SIPs that include a manifest set of
